ADMIT 2027 – Call for Contributions

Subject: [ADMIT @ HiPEAC 2027] Call for Contributions: Accountable Decision-Making and Integrated Trust for Autonomous AI Systems

Dear colleagues,

We are pleased to announce the **first edition of ADMIT: Accountable Decision-Making and Integrated Trust for Autonomous AI Systems**, a half-day workshop at the HiPEAC 2027 Conference. We would be delighted if you would consider submitting a contribution. In particular, we welcome brief, informal contributions intended to spark discussion rather than present polished results.

When and where: Wednesday, January 20, 2027, 14:00–17:30, Scottish Event Campus, Glasgow, UK

Workshop website: <https://admit-workshop.github.io/>

About the workshop

Autonomous systems increasingly bring together AI, software, communication, and hardware to make critical decisions, but failures can have severe consequences. A trustworthy system must recognize when an action is unreliable and move to a safe fallback before harm occurs.

Providing that assurance is difficult in tightly coupled systems with heterogeneous sensors and data sources, safety-critical communication, security mechanisms, specialized hardware and software components, and strict real-time constraints. ADMIT brings the full decision chain into view, from AI-generated decisions to their execution in the physical or digital

world. Autonomous vehicles provide a key motivating example, but the same need for accountable decision-making arises in other autonomous and AI-enabled systems, including automated cyber defense.

More fundamentally, AI, hardware, software, and security are typically developed in isolation and integrated only after the fact, so accountability is retrofitted rather than built in. ADMIT advocates responsibility-by-design: an AI-generated command must be admitted, meaning verified and authorized through a trusted chain, rather than merely computed, before it is executed. This requires combining AI reasoning for reliability assessment, security verification of the execution path, and hardware and software enforcement, all within system constraints.

The workshop brings together researchers and practitioners in AI, cybersecurity, computer architecture, and systems to move from siloed excellence toward genuinely accountable autonomous and AI-enabled systems, safe not by accident, but by construction. As a first edition, we hope this workshop will lay the foundation for a lasting community and series around trustworthy autonomous systems.

What we are looking for

We welcome low-effort, informal contributions from both industry and academia, especially:

- **Work in progress:** early-stage or exploratory ideas where feedback would help.
- **Lessons learned:** experience reports on building or deploying trustworthy, secure, or safety-critical autonomous and AI-enabled systems, including what worked, what didn't, and why.

Topics of interest include:

- **Responsible and trustworthy AI:** reliability and uncertainty assessment, anomaly and attack detection, secure AI, decision-making under uncertainty, and safe fallback decisions.
- **Security and evidence collection:** remote attestation, secure

communication and data paths, runtime security, forensic-ready evidence collection, and auditability of critical decisions.

- **Hardware and real-time enforcement:** accelerators, processing-in-memory or near-data computing, hardware security, trusted execution, and runtime admission control within system constraints.
- **Cross-layer approaches:** methods that connect AI, security, software, and hardware to support accountable decision-making across the system stack.

Format

Accepted contributions will be given a **5–10 minute presentation**, followed by a panel discussion where speakers and attendees can exchange feedback and discuss common challenges.

How to submit

Submit a **one-page PDF presentation proposal** through EasyChair containing the presentation title, author name(s) and affiliation(s), and a short description of the challenge, insight, or lesson you would like to discuss. No template is required.

Please designate **one author as the presenter** when submitting. To encourage broad participation and networking, we generally aim for each person to present at most one contribution.

Presentations are **onsite in Glasgow**; remote presentations will not be available.

Submission: <https://easychair.org/conferences/?conf=admit2027>

Submission deadline: November 15, 2026, 23:59 AoE

Notification: November 30, 2026

There are **no formal proceedings**, and previously published or presented material is welcome. All presenters and participants must register for the HiPEAC conference to attend.

We look forward to your contributions and to seeing you in Glasgow!

Best regards,

Pedro Trancoso and Magnus Almgren
